

Response to increased Energy Demands in the Household Sector

Danfoss is currently preparing the market launch for two new product ranges that are due for release in 2010 – TOP2 and UFO2. These compressors for household applications will assist customers in optimising their product portfolio for the increased energy and noise level demands. Being the most efficient R600a 220V/50Hz household compressors within traditional compressor technology, they will confirm Danfoss as technology leader in its sector.

TOP2 will be a new platform named DLX-KK, UFO2 will be based on the successful platform NL and be labelled NLU-KK. Together they will cover the entire household compressor capacity range, starting from the lowest capacity of 60W all the way up to 250W in cooling capacity (ASHRAE). The new TOP2 and UFO2 range will have superior noise performance in comparison to previous high efficiency compressors. Focus in R&D has, for many years, been efficiency and noise where TOP2 and UFO2 are to be seen as the next step bringing us to the fore.
